

Shoulder Manipulation-Arthroscopy (Frozen Shoulder) Home Care Instructions

The challenge with frozen shoulder release surgery is keeping the range of motion we are able to achieve in the OR. Early aggressive ROM and OT are the key to success.

-Dr. Michael C. Russonella

Sling You will go home with your arm positioned in a sling. Remove the sling tomorrow and begin to move

your shoulder, as tolerated. Continue to wear for comfort for 2 -3 days then discontinue.

Diet Resume your normal diet as tolerated.

Activity

Go home and rest today. If you received sedation or general anesthesia, you may feel tired and drowsy. Therefore, you should not drive a car, operate machinery, drink alcoholic beverages or make any legal decisions for 24 hours, or while taking the narcotic medication. Thereafter, it is critically important that you move your shoulder. Start with pendulums out of the sling (swinging the arm to gravity) and advance as tolerated. Weight-bearing as tolerated to your operative upper extremity. The results of this surgery will not be as successful if you do not move your shoulder. Motion of your hand, wrist and elbow along with the shoulder, will help the arm recover from surgery. You will have had a nerve block with surgery. As anesthesia has mentioned, this will last for up to 24 hours or longer if an indwelling catheter was placed. Use this period to move your shoulder as much as possible.

Pain Medication Resume all medications as prescribed unless otherwise advised. Stop NSAIDS previously prescribed as new medications will take their place in the immediate post-op period. Take pain medication as prescribed only as needed. Narcotic pain medication can cause constipation; drink plenty of water to help with constipation. Regular Tylenol can be substituted for the narcotic medication when able. The first 24-48 hours are the most uncomfortable. Some patient's report having pain after surgery that is quite manageable, other patients report a significant amount of discomfort. The response to the surgery over the first 5 days is quite individual. Do not hesitate to take 2 tablets of the pain medication every 3 hours if needed. Of course, rest, ice and taking it easy for the first few days will have a significant impact on your recovery.

Showering

You may shower in 3 days. Keep the bandages on when you shower. Do not immerse in water for at least one week. After showering change the bandages and cover the incisions with band-aids.

Wound Care & Dressing

Shoulder arthroscopy involves pumping fluid into your shoulder at high pressure. This can cause bruising and sometimes even bruising extending down the arm. This is normal and will resolve. Use the sling for comfort during transit. Keep the dressing clean and dry. If it becomes wet or soiled, report to the office for a dressing change. Leaving a wet or soiled dressing in place can predispose to infection. The dressing will be removed and changed prior to your first post-op visit. Apply ice NOT heat. Heat will increase pain/swelling. Do not apply creams or salves to the wound; this can increase the risk of infection.

Ice

Ice is an excellent source of relief of pain, swelling, stiffness, and inflammation. Use it as often as 15-20 minutes three times a day. You may continue to use ice several weeks following surgery. **DO NOT USE HEAT!**

Michael C. Russonella, D.O. 1373 Broad Street, Suite 309, Clifton, NJ 07013 P: 973-340-1940 F: 973-340-1977

Return Visits The office will call you to schedule your post-operative appointments.

Emergency

Dr. Russonella's staff is available 24 hours a day in case you experience any problems once you leave the hospital. The risk of infection is very low risk. Notify the office if you develop a fever >101°F, with unusual increase in pain, redness, and warmth. Report any pus or unusual drainage to our office immediately. It could be a concern if your incisions swell or have drainage. Persistent swelling in the digits. Pain in the fingers, specifically pain unrelieved by prescribed medications or sustained pain around the thumb, index and long (but not ring and small) fingers. If you develop numbness, tingling, pale, cold or bluish color of fingers, first try to unwrap or loosen the ace bandage around your cast, as there can be significant swelling with surgery. Elevating the wrist also helps. If you encounter any problems, please call our office.

** If you feel chest pain or shortness of breath, please go to the nearest ER for evaluation. Do not call the office or wait for an appointment; although extremely rare, this could be a blood clot in the lungs.**
